

AFC Network Narrative Report

Case ID: testimage1_manual_proxy

Input reference: testimage1.graph.json

Human-Readable Narrative

Alert-review candidate assessment: This graph is a Medium alert-review candidate with score 40. Investigation priority is Medium with score 40. Reason codes:

typology:fan_in_collection, boost:distinct_counterparties. The score means the graph may warrant analyst review; it is not a suspicious activity conclusion and is not a SAR/STR filing decision. What the graph shows: The validated graph contains 12 nodes and 11 directed edges. Detected motifs include fan-in nodes JENNIFER DAVENPORT

(jennifer_davenport), fan-out nodes none, and pass-through relay candidates none. Key extracted entities include JENNIFER DAVENPORT (in-degree 8, out-degree 0, weighted inbound 12625.0, weighted outbound 0.0); KAREN HARTMAN (in-degree 2, out-degree 0, weighted inbound 3880.0, weighted outbound 0.0); CHRIS SCOVONE (in-degree 0, out-degree 2, weighted inbound 0.0, weighted outbound 3783.0); CHAD JAMESON (in-degree 0, out-degree 2, weighted inbound 0.0, weighted outbound 2328.0); ROBERT WHITE (in-degree 0, out-degree 1, weighted inbound 0.0, weighted outbound 2716.0). AFC typology hypothesis: AFC pattern meaning: in AFC terms, fan-in collection means: Multiple sources converge into a central node, which is consistent with a potential collection pattern. In this graph, the pattern is supported by in_degree=8 on node JENNIFER DAVENPORT (jennifer_davenport);

weighted_inbound_amount=12625.0 on node JENNIFER DAVENPORT (jennifer_davenport); repeated_amount_score=0.364 at amount 1200.0. Confidence is 0.714. Fan-in structure alone is not a final suspicious activity conclusion. AFC pattern meaning: in AFC terms, funnel or

master-account activity means: Multiple sources consolidate into a central node, which can resemble a potential funnel or master-account pattern when supported by geography, timing, and customer-purpose context. In this graph, the pattern is supported by

fan_in_nodes=JENNIFER DAVENPORT (jennifer_davenport); inbound_hub_nodes=JENNIFER DAVENPORT (jennifer_davenport). Confidence is 0.544. A funnel-account hypothesis cannot be concluded from graph topology alone. AFC pattern meaning: in AFC terms, inbound hub concentration means: At least one node receives funds from several counterparties, which is consistent with a concentration pattern that may warrant review. In this graph, the pattern is supported by inbound_hub_nodes=JENNIFER DAVENPORT (jennifer_davenport);

fan_in_nodes=JENNIFER DAVENPORT (jennifer_davenport). Confidence is 0.524. Inbound concentration is a review signal and does not establish source-of-funds concerns without customer and transaction context. Why this graph should be reviewed: Medium priority, score 40. Investigation priority is Medium with score 40. Reason codes:

typology:fan_in_collection, boost:distinct_counterparties. The review rationale is based on graph structure and configured AFC skills, not on a finding of wrongdoing. SAR/STR review note: This system does not make SAR or STR filing decisions. Manual review should assess facts, customer context, and additional indicators before any SAR or STR consideration.

SAR red flag review signals: many-to-one collection or funneling review signal: The graph contains a many-to-one concentration pattern that is a SAR/STR red flag review signal when supported by customer, purpose, geography, timing, or counterparty context. Review question: Do multiple counterparties appear to collect or funnel funds into one account,

wallet, profile, or beneficiary without a clear expected purpose? Many-to-one topology alone is not suspicious activity and is not a SAR/STR filing decision. Key entities and

money-flow evidence: fan-in collection: in_degree=8 on node JENNIFER DAVENPORT (jennifer_davenport); weighted_inbound_amount=12625.0 on node JENNIFER DAVENPORT (jennifer_davenport); repeated_amount_score=0.364 at amount 1200.0 funnel or master-account activity: fan_in_nodes=JENNIFER DAVENPORT (jennifer_davenport); inbound_hub_nodes=JENNIFER DAVENPORT (jennifer_davenport) inbound hub concentration: inbound_hub_nodes=JENNIFER DAVENPORT (jennifer_davenport); fan_in_nodes=JENNIFER DAVENPORT (jennifer_davenport) Next analyst checks: Review underlying transactions for timestamps, amounts, settlement direction, and counterparty identifiers.; Compare observed activity against customer profile, expected behavior, and customer baseline.; Check KYC, device, IP, geography, and channel context before drawing conclusions.; Review inbound counterparties for shared attributes or common funding behavior.; Check whether funds move onward from the collection node shortly after receipt.; Review transaction geography, branch or channel information, and expected account purpose.; Check whether consolidated funds move onward and whether locations or counterparties are inconsistent with the customer profile.; Review whether inbound counterparties have shared identifiers, common funding behavior, or a documented relationship to the central node.; Compare inbound activity against the customer's expected profile and historical baseline. Limitations and missing context: Timestamps are absent, so timing, velocity, and sequence cannot be assessed. Customer profile context is absent. KYC, device, and IP context are absent. Geographic context is absent. Transaction channel context is absent. Customer baseline activity context is absent. This output is an investigative aid and does not make a final suspicious activity conclusion. This output does not make a SAR filing decision.

Graph Summary

- Node count: 12
- Edge count: 11
- Repeated amount score: 0.364
- Repeated amount value: 1200.0
- Overall extraction confidence: 0.959

Detected Typologies

- fan-in collection (confidence 0.714): Multiple sources converge into a central node, which is consistent with a potential collection pattern.
- funnel or master-account activity (confidence 0.544): Multiple sources consolidate into a central node, which can resemble a potential funnel or master-account pattern when supported by geography, timing, and customer-purpose context.
- inbound hub concentration (confidence 0.524): At least one node receives funds from several counterparties, which is consistent with a concentration pattern that may warrant review.

Alert Investigation Boost

Medium priority, score 40. Investigation priority is Medium with score 40. Reason codes: typology:fan_in_collection, boost:distinct_counterparties.

SAR Red Flag Review Signals

- This system identifies graph-supported SAR/STR red flag review signals only. It does not decide whether a SAR or STR should be filed.
- many-to-one collection or funneling review signal: The graph contains a many-to-one

concentration pattern that is a SAR/STR red flag review signal when supported by customer, purpose, geography, timing, or counterparty context. Review question: Do multiple counterparties appear to collect or funnel funds into one account, wallet, profile, or beneficiary without a clear expected purpose?

Recommended Investigation Steps

- Review underlying transactions for timestamps, amounts, settlement direction, and counterparty identifiers.
- Compare observed activity against customer profile, expected behavior, and customer baseline.
- Check KYC, device, IP, geography, and channel context before drawing conclusions.
- Review inbound counterparties for shared attributes or common funding behavior.
- Check whether funds move onward from the collection node shortly after receipt.
- Review transaction geography, branch or channel information, and expected account purpose.
- Check whether consolidated funds move onward and whether locations or counterparties are inconsistent with the customer profile.
- Review whether inbound counterparties have shared identifiers, common funding behavior, or a documented relationship to the central node.
- Compare inbound activity against the customer's expected profile and historical baseline.

Limitations and Missing Context

- Timestamps are absent, so timing, velocity, and sequence cannot be assessed.
- Customer profile context is absent.
- KYC, device, and IP context are absent.
- Geographic context is absent.
- Transaction channel context is absent.
- Customer baseline activity context is absent.
- This output is an investigative aid and does not make a final suspicious activity conclusion.
- This output does not make a SAR filing decision.
